

Part 4: Reflection

Susesh SJ — Engineer (Platform) Take-Home Assignment

Debugging took longer than I expected, more than any single feature. Most of the build — the Angular components, Firestore wiring, deployment — went roughly to plan, but tracking down errors along the way (config issues, permission errors, small mismatches between intent and generated code) ate up more time than planning suggested.

If I were starting again, I would plan the Firestore data model fully before writing any code, rather than refining fields and collections as I went. Deciding upfront exactly what "products" and "movements" needed to hold would have avoided some rework later.

The part of the stack I feel least confident in is Angular's architecture around signals and standalone components. I can use them correctly, but I don't yet have a strong intuition for when signals are the right tool versus plain observables, and that's something I want to build a firmer mental model of.
